Postpartum Health Record

#### **Risk indicators**

Have you had any pregnancy-related risk factors for diabetes and heart disease?

Preeclampsia	Yes	No
Gestational hypertension	Yes	No
Gestational diabetes	Yes	No
Placental abruption	Yes	No
Preterm birth (<37 weeks)	Yes	No
Fetal growth restriction	Yes	No
Stillbirth/intrauterine death	Yes	No

If you are unsure whether you experienced any of the above complications, please ask your healthcare provider

#### Women with high blood pressure during pregnancy are at higher risk of future health events

If you have ticked any <u>YES</u> boxes in your background and/or risk indicators

### Did you know?

A history of high blood pressure and gestational diabetes in pregnancy does not mean you will definitely develop heart and diabetes problems, but you should have your current and future heart health and blood sugars monitored to reduce such risk.

### What you can do to reduce such risk

Stay active by exercising at least 150 minutes per week

Aim to have the best body weight

Eat a diverse diet rich in colourful fruits and vegetables, including nuts and seeds; and reduce salt, fats and sugar intake

Live smoke-free

Breastfeed as long as possible

Get at least 6 hours of sleep regularly

See your primary care provider for routine appointments

Space your next pregnancy, seek help from your provider to optimise your health before the next pregnancy and seek early attention when you become pregnant

#### You are advised to take health check-ups and tests

- Tracking your blood pressure is important to manage your heart health risk after pregnancy
- Body weight, body mass index, and waist circumference show overall picture of your health
- Urinalysis for proteinuria is a test of your urine used to detect and manage kidney disease and diabetes.
- A low haemoglobin indicates that you have anaemia and need treatment
- Estimated glomerular filtration rate (eGFR) measures your level of kidney function
- 75g oral glucose tolerance test (OGTT) is used to screen for type 2 diabetes
- HbA1c reflects your average blood sugar levels over the past 3 months

## High blood pressure

Discuss with your doctors

Take medication regularly

Aim to have blood pressure at 130/90 mmHg or lower

### Overweight

Eat a healthy diet

Achieve the best body weight

Stay active by exercising

#### Abnormal test result

Discuss with your doctors

Repeat testing after 6 months
